World Logistics Centers in 2035

Our Vision: 8 nationwide World Logistics Center locations

- All centers integrated under one AI-based Platform as a Service (PaaS) logistics control system.
- Achieves automation and performance optimization across entire network of WLC locations.
- Multi-level variables are embedded in the algorithm of the system to help determine the most efficient flow of logistics.
- Variables will include various product categories & specifications, statistics of past, current, and projected future demands, processing and handling time, delivery distance and time, weather and road conditions, inventory, available and best choice delivery method, special temperature requirements, driver assistance and management, and more.
- Focal emphasis is on overall domestic supply chain efficiency.
- Each WLC will have priority and optimization of regional supply, distribution, and order fulfillment.
- Merchant(s) can choose to sign on to one or multiple WLC network(s) to maximize regional or national logistics efficiency.
- There will be user-friendly apps to keep buyers informed of their order status.
